### 4. Clinical Coaching & Prescription

✓ STRENGTHS \*\* • You logged a `total_duration_min = 0.0`, meaning you kept the session short enough to avoid any unnecessary fatigue. • The sensor recorded `total_exercises = 0`, indicating a complete rest day that can aid recovery when you're feeling tired. \*\* ↑

IMPROVEMENTS \*\* • Capture actual work: the data shows `total_exercises = 0` and `total_reps = 0`; aim to log at least one compound lift (e.g., 3 × 5 × Squat) to generate measurable stimulus. • Increase volume: move from `total_duration_min = 0.0` to a target of `45 min` (or ~30 min of active lifting) to ensure sufficient time under tension for hypertrophy or strength gains. \*\* → NEXT SESSION \*\* For your next workout, prioritize the `lower body` and `back` (e.g., squats, deadlifts, rows) with `3 sets × 8-12 reps` per exercise, raising total duration from `0.0 min` to at least `45 min`. Keep `rest intervals of 90-120 seconds` between sets to balance strength and hypertrophy cues. Log every set and rep so the wearable can capture true workload. Complement the session with a `protein-rich snack` within 30 minutes of finishing to support muscle repair. \*\* ★ \*\* Even a zero-minute log shows you're engaged with your training routine—use that momentum to fill the next session with real reps and watch your progress skyrocket!
